LISTING OF CLAIMS:

- 1. (previously presented) A method for ensuring the integrity of at least one computer software program which can be carried out by means of at least one encryption/decryption module, the at least one computer software program being transmitted, by means of a transmitter, to a decoder which is equipped with the at least one encryption/decryption module by means of a long-distance information transmission network, the transmitter performing the steps comprising:
- a) a step (40) for encrypting information signals transmitted to the decoder,
- b) a step (50) for transmitting, to the at least one encryption/decryption module of the decoder, a message containing the information required for the decoder to decrypt the information signals transmitted at step a), and
- c) a step (42, 100) for transmitting the at least one computer software program to the at least one encryption/decryption module of the decoder,

the decoder carrying out:

d) a step (74) for decrypting the information signals transmitted by the transmitter during step a) using the information provided for this purpose in the message transmitted during step b),

e) a step for constructing a single identifier for a group of several computer software programs to be transmitted during step c) based on information relating to each of the software programs of the group and in that the at least one encryption/decryption module carries out the same operation as that carried out during step e) in order to reconstruct a unique identifier corresponding to that constructed during step e) if the group received by the decoder is identical to that transmitted by the transmitter,

wherein,

the transmitter inserts (at 52, 124) in the message transmitted during step b) an additional item of information which allows the at least one encryption/decryption module to verify that it has effectively received the or each computer software program transmitted at step c),

the at least one encryption/decryption module verifies (at 60), based on the additional information inserted by the transmitter in the message transmitted during step b), whether it has effectively received the or each software program transmitted during step c), and

if the or each software program has not been received, the at least one encryption/decryption module prevents step d) (at 68).

- 2. (previously presented) The method according to claim 1, wherein the transmitter encrypts (at 50) the message transmitted at step b), and in that the at least one encryption/decryption module decrypts the message transmitted during step b) in order to allow step d) to be carried out.
- 3. (previously presented) The method according to claim 1, wherein the transmitter carries out:
- f) a step (52, 124) for inserting this identifier in the message transmitted during step b),

and in that the at least one encryption/decryption module carries out:

- g) a step (62, 110) for reconstructing the identifier of the or each computer software program based on the or each computer software program received,
- h) a step (66, 112) for comparing the identifier reconstructed at step g) with the identifier inserted by the transmitter during step f), and
- i) if the identifier reconstructed at step g) does not correspond to that inserted at step f) in the message transmitted at step b), a step (68, 108) for preventing step d),
- j) if the identifier reconstructed at step g) corresponds to the identifier inserted at step f) in the message transmitted during step b), a step (66, 112) for validating the integrity of the or each computer software program.

4. (cancelled)

- 5. (previously presented) The method according to claim 3, wherein the steps d), g), h), i) and j) are carried out by the same encryption/decryption module.
- 6. (previously presented) The method according to claim 3, wherein a first autonomous encryption/decryption module carries out only steps d), h), i) and j), and in that a second autonomous encryption/decryption module which is independent from the first encryption/decryption module and which is fixedly joined to the decoder carries out at least step g).
- 7. (previously presented) The method according to claim 6, wherein the transmitter further performing the steps comprising:
- k) a second step (120) for constructing a second identifier of the or each computer software program transmitted during step c), this second identifier being transmitted together with the or each corresponding software program during step c), and
- in that step g) which is carried out by the second encryption/decryption module comprises:

- an operation (102) for reconstructing the second identifier which is transmitted together with the or each software program,
- only if the second reconstructed identifier corresponds to that transmitted together with the or each software program during step c), an operation (110) for reconstructing the first identifier inserted in the message transmitted during step b) and for transmitting this first reconstructed identifier to the first encryption/decryption module so that the first encryption/decryption module can carry out step h).
- 8. (previously presented) The method according to claim 7, wherein the first and the second identifiers are obtained from the same identifier of the or each computer software program by encrypting the same identifier using a different first and second encryption key, respectively.
- 9. (previously presented) The method according to claim 2, wherein the at least one encryption/decryption module carries out the at least one computer software program each time the integrity thereof is validated during step j).

- 10. (previously presented) An information recording medium (12) with a computer program recorded thereon comprising instructions for carrying out a method according to claim 1, when the instructions are carried out by the transmitter (4).
- 11. (previously presented) An information recording medium (22, 88) with a computer program recorded thereon comprising instructions for carrying out a method according to claim 1, when the instructions are to be carried out by the at least one encryption/decryption module.
- 12. (previously presented) A system for ensuring the integrity of at least one computer software program which can be carried out by at least one encryption/decryption module (16, 84), the system comprising:
- a transmitter (4) for transmitting the at least one computer software program via a long-distance information transmission network (8), and a decoder (6, 82) which is equipped with the at least one encryption/decryption module (16, 84),

the transmitter (4) being capable of:

encrypting information signals transmitted to the or each decoder,

- transmitting to the at least one encryption/decryption module of the decoder a message containing the information required for the decoder to decrypt the information signals transmitted, and
- transmitting the at least one computer software program to the at least one encryption/decryption module of the decoder,
- the decoder (6, 82) being capable of decrypting the information signals transmitted by the transmitter using the information which is provided for this purpose and which is contained in the message transmitted by the transmitter,
- constructing a single identifier for a group of several computer software programs to be transmitted during the transmitting the at least one computer software program to the at least one encryption/decryption module of the decoder based on information relating to each of the software programs of the group and in that the at least one encryption/decryption module carries out the same operation as that carried out during constucting in order to reconstruct a unique identifier corresponding to that constructed during constucting if the group received by the decoder is identical to that transmitted by the transmitter,

wherein, the transmitter (4) is capable of inserting in the message an additional item of information which allows the at least one encryption/decryption module (46, 84) to verify that it has received the or each computer software program transmitted,

the at least one encryption/decryption module (16, 84) is capable of verifying, based on the additional information inserted by the transmitter in the message, whether it has effectively received the or each software program transmitted by the transmitter, and

if the or each software program has not been received, the at least one encryption/decryption module (16, 84) is capable of preventing the decryption of the information signals transmitted.

- 13. (previously presented) The system according to claim 12, wherein the or each decoder (6) is equipped with a single removable encryption/decryption module.
- 14. (previously presented) The system according to claim 12, wherein the or each decoder (82) is equipped with at least two autonomous encryption/decryption modules which are independent from each other, at least one of these encryption/decryption modules being fixedly joined to the body of the decoder.

- 15. (previously presented) A transmitter (4) which is suitable for carrying out a method according to claim 1, this transmitter (4) being capable of:
- encrypting information signals transmitted to the or each decoder,
- transmitting to the at least one encryption/decryption module of the decoder a message containing the information required for the decoder to decrypt the information signals transmitted, and
- transmitting the at least one computer software program to the at least one encryption/decryption module of the decoder,

wherein

the transmitter (4) is capable of inserting in the message an additional item of information which allows the at least one encryption/decryption module (46, 84) to verify that it has received the or each computer software program transmitted.

16. (previously presented) The decoder (6, 82) which is suitable for carrying out a method according to claim 1, this decoder (6, 82) being capable of decrypting the information signals transmitted by the transmitter using the information which is provided for this purpose and which is contained in the message transmitted by the transmitter, and being equipped with the at least one encryption/decryption module (16, 84);

Docket No. 0512-1290 Appln. No. 10/542,630

wherein,

the at least one encryption/decryption module (16, 84) is capable of verifying, based on the additional information inserted by the transmitter in the message, whether it has effectively received the or each software program transmitted by the transmitter, and

if the or each software program has not been received, the at least one encryption/decryption module (16, 84) is capable of preventing the decryption of the information signals transmitted.

- 17. (previously presented) The decoder (6, 82) according to claim 16, wherein the decoder is equipped with a single removable encryption/decryption module.
- 18. (previously presented) The decoder (6, 82) according to claim 16, wherein the decoder is equipped with at least two autonomous encryption/decryption modules which are independent from each other, at least one of these encryption/decryption modules being fixedly joined to the body of the decoder.
- 19. (previously presented) The method according to claim 2, the transmitter carries out:

f) a step (52, 124) for inserting this identifier in the message transmitted during step b),

and in that the at least one encryption/decryption module carries out:

- g) a step (62, 110) for reconstructing the identifier of the or each computer software program based on the or each computer software program received,
- h) a step (66, 112) for comparing the identifier reconstructed at step g) with the identifier inserted by the transmitter during step f), and
- i) if the identifier reconstructed at step g) does not correspond to that inserted at step f) in the message transmitted at step b), a step (68, 108) for preventing step d),
- j) if the identifier reconstructed at step g) corresponds to the identifier inserted at step f) in the message transmitted during step b), a step (66, 112) for validating the integrity of the or each computer software program.
- 20. (previously presented) Method according to claim 1, wherein a first autonomous encryption/decryption module carries out only steps d), h), i) and j), and in that a second autonomous encryption/decryption module which is independent from the first encryption/decryption module and which is fixedly joined to the decoder carries out at least step g).
